

electron/workspace-files.cjs

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T21:19:06.509Z

Overview

A new CommonJS module `electron/workspace-files.cjs` (lines 1-85) exposes utilities for snapshot files used by the Electron renderer.

Key changes

- **Imports** (R3-R5): `fssync`, `fsp`, and `path` are required for synchronous existence checks, async I/O, and path resolution.
- **SKIP_DIRS** (R7-R15): a `Set` containing `.git`, `node_modules`, `dist`, `build`, `target`, `.novadiff-graph`, and `snapshots` that the walker ignores.
- **listSnapshotFiles(snapshotRoot, opts = {})** (R17-R60):
 - Resolves `snapshotRoot` (R18).
 - Uses `opts.maxFiles` (default 2500, R19).
 - Recursively walks the directory tree (R25-R55), skipping hidden entries except `.env` (R39-R42) and directories in `SKIP_DIRS` (R47-R49).
 - Returns a sorted array of relative paths (R58).
- **readSnapshotTextFile(snapshotRoot, relPath, maxBytes = 512 KB)** (R61-R80):
 - Validates `snapshotRoot` and `relPath` (R64-R70).
 - Reads the file asynchronously (R71).
 - If the file exceeds `maxBytes`, returns the first `maxBytes` bytes, sets `truncated: true`, and reports the full size (R73-R77).
 - Otherwise returns the full content with `truncated: false` (R79).
- **Exports** (R82-R85): both functions are exported via `module.exports`.

Impact

- **Path safety:** validation prevents directory traversal (R64-R70).
- **Memory guard:** large files are truncated to 512 KB (R73-R77).
- **Centralization:** snapshot file logic is now in a single module, reducing duplication.

Risks & follow-ups

- **Directory skipping:** verify that nested `.git` and `node_modules` directories are correctly ignored.
- **Path validation:** test inputs with `..` or absolute paths to ensure the error is thrown.
- **Truncation threshold:** confirm 512 KB suits the intended use cases; adjust if larger files are common.
- **Edge cases:** add tests for empty roots, non-existent files, and files exactly at the `maxBytes` limit.
