

packages/graph-core/package.json

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:21:26.887Z

Overview

A new file `packages/graph-core/package.json` (added at line 1–58) introduces the `@novadiff/graph-core` npm package. The manifest declares ESM support (`"type":"module"`) and points to compiled outputs (`"main":"dist/index.js"` , `"types":"dist/index.d.ts"`).

Key changes

- **Package metadata** – `name` , `version` , `type` , `main` , `types` (lines 1–6).
- **Exports map** – entries for `"/search"` , `"/types"` , `"/schema"` , `"/languages"` with corresponding `.d.ts` and `.js` paths (lines 7–27).
- **Scripts** – `build` (`tsc`), `catalog:generate` (node script), `test` (`vitest run`) (lines 29–33).
- **DevDependencies** – TypeScript `^5.7.0` , Vitest `^3.1.0` , coverage plugin, Node type definitions (lines 34–39).
- **Dependencies** – `fuse.js` , `ignore` , a suite of `tree-sitter-*` parsers, `web-tree-sitter` , `yaml` , `zod` (lines 40–56).

Impact

- **Build & test** – Running `npm install` , `npm run build` , and `npm run test` is required to confirm compilation and unit tests (deterministic verification hint).
- **ESM behavior** – The `type: module` flag may affect import syntax for consumers.
- **Dependency footprint** – The added parsers and `web-tree-sitter` increase install size and potential bundle size.
- **TypeScript integration** – Exported `.d.ts` files provide type definitions for consumers.

Risks & follow-ups

- **Export correctness** – Unknown from the available diff/scan evidence; verify that each `"/<module>"` export resolves correctly (e.g., via `npm pack`).
- **Test coverage** – Unknown; run `npm run test` and inspect coverage thresholds.
- **Dependency conflicts** – Unknown; check compatibility of the new `tree-sitter-*` versions with other projects.
- **Node version compatibility** – Unknown; ensure ESM configuration works on target Node LTS releases.
