

packages/graph-core/src/__tests__/domain-normalize.test.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:04:38.947Z

Overview

A new test file `packages/graph-core/src/__tests__/domain-normalize.test.ts` has been added to verify the `normalizeNodeId` helper for domain, flow, and step node types.

Key changes

- **Imports added**

- R1 added: `import { describe, it, expect } from "vitest";`
- R2 added: `import { normalizeNodeId } from "../analyzer/normalize-graph.js";`

- **Test cases added (R4–R46)**

- Domain node: `normalizeNodeId("domain:order-management", { type: "domain", name: "Order Management" })` → `"domain:order-management"`
- Flow node: `normalizeNodeId("flow:create-order", { type: "flow", name: "Create Order" })` → `"flow:create-order"`
- Step node with `filePath`: `normalizeNodeId("step:create-order:validate", { type: "step", name: "Validate", filePath: "src/validators/order.ts" })` → `"step:create-order:src/validators/order.ts:validate"`
- Step node without `filePath`: `normalizeNodeId("step:validate", { type: "step", name: "Validate" })` → `"step:validate"`
- Bare step name with `filePath`: `normalizeNodeId("validate", { type: "step", name: "Validate", filePath: "src/validators/order.ts" })` → `"step:src/validators/order.ts:validate"`

Impact

The added tests confirm that `normalizeNodeId` preserves existing IDs for domain and flow nodes and formats step node IDs correctly, including optional `filePath` handling. This provides a concrete regression guard for future changes to the normalization logic.

Risks & follow-ups

- **Implementation mismatch:** If `normalizeNodeId` does not handle the step-with-`filePath` case, the corresponding test will fail; run the test suite to verify.
- **Edge cases:** Current tests cover typical patterns; consider adding cases for empty or malformed inputs if the function is expected to handle them.
- **CI integration:** Ensure the new test file is picked up by the `vitest` configuration and appears in coverage reports.
