

packages/graph-core/src/__tests__/domain-types.test.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:05:51.734Z

Overview

A new test file `packages/graph-core/src/__tests__/domain-types.test.ts` (lines 1-141) was added. It imports `vitest`, `validateGraph` from `../schema.js`, and the `KnowledgeGraph` type from `../types.js`.

Key changes

- **Sample graph** (`domainGraph`, lines 5-62) contains 3 nodes (`domain`, `flow`, `step`) and 2 edges (`contains_flow`, `flow_step`).
- **Tests** (lines 67-141) verify:
 - node/edge counts (lines 68-73)
 - correct edge types (lines 76-85)
 - handling of a `cross_domain` edge added to a cloned graph (lines 88-108)
 - normalization of node type aliases (`business_*` → canonical) (lines 110-120)
 - normalization of edge type aliases (`has_flow`, `next_step` → canonical) (lines 122-130)
 - preservation of the `domainMeta` field on the flow node (lines 132-140).

Impact

- Provides a concrete, validated graph example for the `validateGraph` schema.
- No production code changes; only tests.
- Any failure will surface in CI, preventing regressions in graph validation logic.

Risks & follow-ups

- **Schema drift:** if the graph schema evolves, these tests may fail; run `npm test` after schema changes.
- **Alias handling:** ensure `validateGraph` continues to map `business_*` and `has_flow` / `next_step` to canonical types; otherwise normalization tests fail.
- **Cross-domain support:** verify that the `cross_domain` edge type remains valid in the schema.
- **Linting/build:** run `npm run lint` and `npm run build` to confirm the new test file passes style and compilation checks.
