Overview

A new test file `packages/graph-core/src/__tests__/framework-registry.test.ts` has been added.

The file contains imports (R1-R4) and a suite of tests covering registration, lookup, detection, default registry creation, and immutability (R6-R123).

Key changes

- **Imports added**
 - `vitest` helpers (R1)
 - `FrameworkRegistry` (R2)
 - `djangoConfig` and `reactConfig` (R3-R4)
- **CRUD tests** (R6-R11) verify `register`, `getById`, and `getForLanguage`.
- **Detection logic tests** (R13-R82) exercise `detectFrameworks` against `requirements.txt`, `package.json`, case-insensitivity, no-match, empty manifests, duplicate detection, and cross-language support.
- **Default registry tests** (R84-R122) confirm `FrameworkRegistry.createDefault()` registers 10 built-in frameworks and exposes them across multiple languages.
- **Immutability check** (R100-R106) ensures `getForLanguage` returns a copy, not the internal array.

Impact

- **Correctness:** The tests enforce expected behavior of registration, lookup, and detection logic.
- **Coverage:** Adds unit coverage for edge cases such as duplicate entries and empty inputs.
- **Maintainability:** Future changes to `FrameworkRegistry` must satisfy these tests, providing a safety net for refactors.
- **Observability:** Failures will pinpoint specific methods (e.g., `detectFrameworks`, `createDefault`) that deviate from expectations.

Risks & follow-ups

- **API drift:** If `FrameworkRegistry`'s public API changes (e.g., method signatures), the tests will fail; review recent refactors.
- **Detection logic changes:** Modifying heuristics could break `detectFrameworks` tests; ensure new patterns are reflected in expectations.
- **Default config count:** The test expects exactly 10 built-in frameworks; adding or removing defaults will require updating the assertion.

- **Immutability contract:** If the implementation changes to return a reference instead of a copy, the immutability test will fail; verify that `getForLanguage` still returns a new array.
