

packages/graph-core/src/__tests__/language-lesson.test.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:09:16.777Z

Overview

A new test file `packages/graph-core/src/__tests__/language-lesson.test.ts` (lines R1-R157) was added to exercise the language-lesson analyzer.

Key changes

- Imports added at the top of the file (lines 1-8): `vitest` helpers, `buildLanguageLessonPrompt`, `parseLanguageLessonResponse`, `detectLanguageConcepts` from `../analyzer/language-lesson.js`, type imports for `GraphNode` / `GraphEdge`, and `typescriptConfig` from `../languages/configs/typescript.js`.
- Sample graph data defined (lines 10-35): a `sampleNode` (function `verifyToken`) and `sampleEdges` describing `reads_from` and `calls` relationships.
- Test suites (lines 38-157) cover:
 - `buildLanguageLessonPrompt`: verifies inclusion of node name, summary, target language, relationship context, and a request for JSON output.
 - `parseLanguageLessonResponse`: tests parsing of a plain JSON string, extraction from a fenced code block, and graceful handling of an empty string.
 - `detectLanguageConcepts`: checks detection of async patterns, middleware patterns, and that no concepts are returned for a plain file node.

Impact

- Adds unit coverage for the analyzer utilities, enabling regression detection when prompt formatting or response parsing logic changes.
- Keeps test data and expectations in a single file, simplifying future updates to the analyzer.

Risks & follow-ups

- Test flakiness:** JSON parsing must remain deterministic; run tests locally to confirm stability.
- Formatting changes:** If prompt generation logic changes, test expectations may need updating (`vitest --update`).
- Linting:** Ensure the new file passes the repository's TypeScript and ESLint checks (`tsc`, `eslint`).
- Coverage gaps:** Unknown from the available diff/scan evidence; consider adding more scenarios if coverage is low.
