

packages/graph-core/src/__tests__/language-registry.test.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:09:48.168Z

Overview

A new test file `packages/graph-core/src/__tests__/language-registry.test.ts` (lines R1-198) was added to exercise the `LanguageRegistry` implementation and its schema enforcement.

Key changes

- **Imports** added at the top of the test file:
 - `vitest` helpers (`describe` , `it` , `expect`) – R1.
 - `LanguageRegistry` – R2.
 - `StrictLanguageConfigSchema` – R3.
 - Sample configs (`typescriptConfig` , `pythonConfig`) – R4-R5.
- **Registry behavior tests:**
 - Registering a config and retrieving it by ID, extension, or file path.
 - Null returns for unknown extensions or files lacking extensions.
 - `getAllLanguages()` returns the full set of registered configs.
- **Default registry tests** (`LanguageRegistry.createDefault()`):
 - Confirms 40 built-in configs are registered (line 53-56).
 - Verifies mapping for common extensions (`.ts` , `.py` , `.go` , etc.) (lines 60-74).
 - Checks that no extension is mapped to more than one config (lines 78-85).
 - Ensures every config contains at least one concept (lines 89-92).
- **Non-code language detection:** tests for README, YAML, JSON, Dockerfile, Makefile, `.env` variants, and filename-based configs (lines 98-131).
- **Schema validation tests:** use `StrictLanguageConfigSchema.safeParse` to reject configs lacking extensions or filenames and accept valid combinations (lines 149-196).

Impact

- Provides concrete assertions for registry lookup logic and default configuration coverage.
- Detects regressions in extension mapping, duplicate mappings, and concept presence.
- Validates that the schema enforces the presence of at least one extension or filename.

Risks & follow-ups

- **Fragility:** Tests depend on the exact list of 40 built-in configs; adding or removing configs will require test updates.
- **Performance:** `createDefault()` is exercised; significant slowdowns in registry construction would surface here.
- **Schema drift:** If `StrictLanguageConfigSchema` changes, the validation tests may need adjustment.

- **Regression:** Run the full test suite after any registry refactor to ensure no unintended behavior changes.
