

packages/graph-core/src/__tests__/parsers.test.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:11:29.726Z

Overview

A new test file, `packages/graph-core/src/__tests__/parsers.test.ts` (lines R1-629), has been added. It imports `vitest` helpers and all 12 parser classes plus `stripJsonSyntax` and `registerAllParsers`. The file contains unit tests that exercise each parser with realistic content and edge-case scenarios.

Key changes

- **Imports** – Lines R1-R6 add `vitest` (`describe`, `it`, `expect`) and parser imports (`MarkdownParser`, `YAMLConfigParser`, `JSONConfigParser`, `TOMLParser`, `EnvParser`, `DockerfileParser`, `SQLParser`, `GraphQLParser`, `ProtobufParser`, `TerraformParser`, `MakefileParser`, `ShellParser`) plus `stripJsonSyntax` and `registerAllParsers`.
- **Parser tests** – Each `describe` block (e.g., `MarkdownParser`, `YAMLConfigParser`, ...) contains tests that assert sections, imports, references, definitions, and edge cases such as fenced code blocks, YAML front-matter, JSONC comments, TOML tables, Dockerfile stages, SQL view/replace syntax, GraphQL input types, Protobuf enums, Terraform modules, Makefile `.PHONY`, and Shell function syntax.
- **Registry test** – Lines 611-629 verify that `registerAllParsers` registers all 12 parsers and that the registry reports the expected language identifiers.

Impact

- **Correctness** – The tests provide a safety net for future parser changes, catching regressions in extraction logic and language registration.
- **Maintenance** – Any incomplete parser implementation will cause a test failure, surfacing issues immediately during CI.
- **Performance** – The added tests are lightweight; the overall test suite size grows but runtime impact is minimal.
- **Observability** – Failures pinpoint the specific parser and scenario, aiding rapid debugging.

Risks & follow-ups

- **Implementation gaps** – If a parser is incomplete, its tests will fail; review implementation against the expectations.
- **Snapshot/fixture drift** – Tests rely on exact output structures; intentional API changes must be reflected in the test expectations.
- **Environment setup** – `vitest` must be correctly configured; otherwise the entire suite may fail.

- **Edge-case coverage** – While extensive, rare syntax variations may still be missed; monitor for false negatives in production.
