

packages/graph-core/src/__tests__/plugin-discovery.test.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:11:59.004Z

Overview

A new test file `packages/graph-core/src/__tests__/plugin-discovery.test.ts` (lines 1-116) has been added to validate the plugin-discovery utilities exported from `../plugins/discovery.js`. The tests exercise parsing, default configuration, and serialization logic.

Key changes

- **Imports** (lines 1-8):

```
``ts import { describe, it, expect } from "vitest"; import {
  parsePluginConfig, serializePluginConfig, type PluginConfig, type PluginEntry,
  DEFAULT_PLUGIN_CONFIG, } from "../plugins/discovery.js";
```
- **Parsing tests** (lines 10-72): verify that `parsePluginConfig`
 - parses valid JSON with multiple plugins,
 - falls back to `DEFAULT_PLUGIN_CONFIG` on invalid JSON, empty string, or a non-array `plugins` field,
 - filters out entries missing required fields (`name` , `languages`), and
 - defaults `enabled` to `true` when omitted.
- **Default config test** (lines 75-81): ensures `DEFAULT_PLUGIN_CONFIG` contains a single enabled `tree-sitter` plugin.
- **Serialization tests** (lines 83-115): confirm that `serializePluginConfig` produces JSON containing `name` , `enabled` , `languages` , and correctly serializes an optional `options` field.

Impact

- **Correctness:** The tests guarantee that the parsing and serialization functions handle edge cases and defaults as intended.
- **Maintainability:** Future refactors of the plugin-discovery module will be caught early by this test suite.
- **Observability:** No runtime changes; tests run during CI.
- **Compatibility:** No public API changes; only test coverage is expanded.

Risks & follow-ups

- **Regression risk:** If `parsePluginConfig` or `serializePluginConfig` are altered, the tests may fail; run the full suite after any related refactor.
- **Test fragility:** Assertions rely on exact string containment (e.g., `"name": "tree-sitter"`); if the serialization format changes, update the tests.
- **Coverage gap:** The current tests cover typical scenarios but not deeply nested `options` objects; consider adding such cases if needed.

- **CI load:** Adding a test file increases test count; monitor CI duration for any slowdown.
