

packages/graph-core/src/__tests__/plugin-registry.test.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:12:32.518Z

Overview

A new test file `packages/graph-core/src/__tests__/plugin-registry.test.ts` has been added. It exercises the `PluginRegistry` API and the `registerAllParsers` helper, ensuring that plugins are registered, looked-up, and cleaned up correctly, and that file-type parsing works for a variety of minimal inputs.

Key changes

- **Imports** (lines 1-4): `vitest` helpers, `PluginRegistry`, `registerAllParsers`, and type imports from `../types.js`.
- **createMockPlugin helper** (lines 13-20) builds minimal `AnalyzerPlugin` objects for the tests.
- **Registry tests** (lines 22-140) cover:
 - registration, language/file lookup, and priority handling.
 - `getSupportedLanguages`, `unregister`, and language-map rebuild logic.
 - Delegation of `analyzeFile` and `resolveImports`, including a test for a plugin that omits `resolveImports`.
- **Smoke test for `registerAllParsers`** (lines 197-228) registers all parsers and verifies that each returns a non-null `StructuralAnalysis` for a minimal content snippet. The test iterates over 12 file types: `README.md`, `config.yaml`, `config.json`, `config.toml`, `.env`, `Dockerfile`, `schema.sql`, `schema.graphql`, `types.proto`, `main.tf`, `Makefile`, `script.sh`.

Impact

- **Correctness:** The tests expose edge cases in plugin lookup and lifecycle, tightening the observable contract for `PluginRegistry`.
- **Maintainability:** `createMockPlugin` centralizes mock creation, reducing duplication.
- **Observability:** Failure messages include file-path context (e.g., `analyzeFile should return a result for ${filePath}`), aiding debugging.
- **Performance:** The smoke test runs ~12 iterations; negligible CI impact.

Risks & follow-ups

- **Regression risk:** Changes to `PluginRegistry` may cause many tests to fail; run the full suite after any implementation change.
- **Optional `resolveImports` handling:** Verify that non-code plugins (e.g., the markdown plugin test) still return `null` for imports.
- **Parser registration:** Ensure `registerAllParsers` registers all parsers; inspect the test case list for omissions.

- **Snapshot drift:** No snapshots are used; if parser outputs change, update the structural-analysis shape assertions accordingly.
