

packages/graph-core/src/__tests__/staleness.test.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:14:40.369Z

Overview

A new test file `packages/graph-core/src/__tests__/staleness.test.ts` validates the staleness utilities (`getChangedFiles` , `isStale` , `mergeGraphUpdate`). It mocks `child_process.execFileSync` (lines 1-6) and uses helper constructors (`makeGraph` , `makeNode` , `makeEdge` – lines 14-32) to build deterministic graph fixtures.

Key changes

- **Imports & mocking** – added Vitest imports and a mock for `child_process` (lines 1-6).
- **Graph helpers** – `makeGraph` , `makeNode` , `makeEdge` provide reusable fixtures (lines 14-32).
- **`getChangedFiles` tests** – verify git diff parsing, empty results, and error handling (lines 56-86).
- **`isStale` tests** – confirm stale flag and changed file list (lines 89-110).
- **`mergeGraphUpdate` tests** – cover node replacement, edge pruning, and metadata updates (lines 113-252).
- **Timestamp validation** – checks that `project.analyzedAt` falls between two timestamps (lines 242-251).

Impact

- Adds explicit unit tests for staleness logic, reducing ambiguity around expected behavior.
- Centralizes graph construction helpers, lowering duplication in future tests.
- Provides concrete assertions on edge removal and timestamp updates, aiding debugging.

Risks & follow-ups

- The global `child_process` mock may affect other tests; run the full suite to confirm isolation.
- The timestamp test assumes `analyzedAt` is set to the current time; if the implementation changes to a fixed value, the test will fail.
- Current tests cover typical scenarios; consider adding cases for circular dependencies or missing nodes.
- Unknown from the available diff/scan evidence whether the mock interferes with other test suites.
