

packages/graph-core/src/analyzer/llm-analyzer.test.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:56:57.614Z

Overview

A new test file `packages/graph-core/src/analyzer/llm-analyzer.test.ts` has been added. It imports the Vitest helpers (`describe` , `it` , `expect`) and the four LLM-analyzer utilities from `./llm-analyzer.js` . The file contains unit tests for prompt construction and JSON response parsing.

Key changes

- **Imports added** (lines R1-R7):

```
``ts import { describe, it, expect } from "vitest"; import { buildFileAnalysisPrompt, buildProjectSummaryPrompt, parseFileAnalysisResponse, parseProjectSummaryResponse, } from "./llm-analyzer.js";
```

```
- `buildFileAnalysisPrompt` is verified to embed file path, content, project context, and JSON schema markers.
- `buildProjectSummaryPrompt` checks that a file list and optional sample contents are included correctly.
- **Response-parsing tests** (lines 36-156, 182-247):
  - `parseFileAnalysisResponse` is exercised against valid JSON, markdown-wrapped JSON, missing fields, invalid inputs, and default handling for `complexity`.
  - `parseProjectSummaryResponse` tests valid JSON, markdown fences, missing fields, and invalid JSON.
```

Impact

```
- Provides confidence that prompt construction and JSON parsing behave as intended, catching regressions early.
- No snapshots are used; failures will surface detailed assertion messages.
```

Risks & follow-ups

```
- Tests are brittle to changes in the prompt format; review the prompt specification before refactoring.
- The current suite does not cover nested markdown or non-JSON responses; consider adding such cases if the LLM output format evolves.
- Verify that `npm run lint`, `npm test`, and `npm run build` succeed after adding this file.
```
