

## packages/graph-core/src/languages/catalog-types.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:40:10.188Z

### Overview

A new file `packages/graph-core/src/languages/catalog-types.ts` has been added. It declares and exports the `LanguageCatalogEntry` interface, which defines the shape of catalog entries used for language support.

### Key changes

- **Exported interface** `LanguageCatalogEntry` (lines 1-7).
- Required properties:
  - `id: string` – unique identifier.
  - `displayName: string` – human-readable name.
  - `extensions: string[]` – list of file extensions.
- Optional properties:
  - `wasmsFile?: string` – path to a WebAssembly module.
  - `filenames?: string[]` – specific file names associated with the language.

### Impact

- The interface is now available to other modules via the export statement.
- No JavaScript runtime code is added; the change is purely type-level.
- Linting will flag any unused imports of this interface.
- The build output will include the new file; run `npm run build` to confirm inclusion.

### Risks & follow-ups

- **Unused export:** Verify that imports of `LanguageCatalogEntry` are actually used; otherwise, linting will report unused variables.
- **Integration:** Modules that consume catalog entries should import this interface to maintain type consistency.
- **Test coverage:** Unknown from the available diff/scan evidence whether tests need updating to construct `LanguageCatalogEntry` objects.
- **Build consistency:** Ensure the new file is compiled by running the repository's build commands.
