Overview

`packages/graph-core/src/languages/types.ts` now defines Zod schemas for language and framework configuration objects.

The file adds an import of `z` from **zod** (line 1) and exports several schemas and inferred types (lines 8-68).

Key changes

- **Import:** `import { z } from "zod"` (R1).
- **Tree-sitter config:**
 - `TreeSitterConfigSchema` – a union of two object shapes (R8-17).
 - `TreeSitterConfig` inferred type (R19).
- **File pattern config:**
 - `FilePatternConfigSchema` (R22-27).
 - `FilePatternConfig` inferred type (R29).
- **Language config:**
 - `LanguageConfigSchema` with fields `id`, `displayName`, `extensions`, optional `filenames`, optional `treeSitter`, `concepts`, and `filePatterns` (R32-40).
 - `LanguageConfig` inferred type (R42).
 - `StrictLanguageConfigSchema` refines `LanguageConfigSchema` to require at least one extension or filename (R51-54).
- **Framework config:**
 - `FrameworkConfigSchema` with fields `id`, `displayName`, `languages`, `detectionKeywords`, `manifestFiles`, `promptSnippetPath`, optional `entryPoints`, optional `layerHints` (R57-66).
 - `FrameworkConfig` inferred type (R68).

Impact

- Provides **runtime validation** of config objects via Zod, catching malformed data earlier.
- Centralizes schema definitions, reducing duplication and easing future changes.
- Existing code that used plain TypeScript types can import the new inferred types without breaking the public API.

Risks & follow-ups

- **Missing `zod` dependency:** the package must list `zod` in its `package.json`.
- **Unused file:** it is unknown from the diff whether the new schemas are referenced elsewhere.
- **Test coverage:** no tests are added in this change; adding tests would confirm validation behavior.

- **Performance:** runtime validation incurs overhead; benchmark if many configs are processed at startup.
