Overview

A new persistence module (`packages/graph-core/src/persistence/index.ts`) is added. It centralises file-system helpers for knowledge graphs, metadata, fingerprints, and configuration. The module introduces path sanitisation, directory creation, and optional schema validation.

Key changes

- **Imports** (lines 1-5) bring in `fs` , `path` , type definitions, and `validateGraph` .
- `ensureDir(projectRoot)` (lines 13-19) creates the `.novadiff-graph` directory if missing and returns its path.
- `sanitiseFilePaths(graph, projectRoot)` (lines 38-66) converts absolute node paths to relative or filename-only forms, preventing leakage of the developer's directory layout.
- `saveGraph` / `loadGraph` (lines 69-106) persist the graph as `knowledge-graph.json` . `loadGraph` optionally validates via `validateGraph` .
- `saveMeta` / `loadMeta` (lines 107-116) handle `meta.json` .
- `saveFingerprints` / `loadFingerprints` (lines 118-131) manage `fingerprints.json` .
- `saveConfig` / `loadConfig` (lines 135-148) read/write `config.json` with a default `{ autoUpdate: false, outputLanguage: "en" }` .
- `saveDomainGraph` / `loadDomainGraph` (lines 152-182) mirror graph persistence under `domain-graph.json` .

Impact

- **Privacy**: Sanitisation guarantees that no absolute paths are written to disk.
- **Data integrity**: Validation in `loadGraph` / `loadDomainGraph` throws on malformed data, preventing downstream errors.
- **Maintainability**: Centralised persistence logic replaces scattered file handling across the repo.
- **Compatibility**: Callers must import the new functions from this module; legacy imports may need updating.

Risks & follow-ups

- **Windows path handling**: `isAbsolute` and `relative` may behave differently; run tests on Windows to confirm sanitisation.
- **Error propagation**: `loadGraph` throws on validation failure; callers should handle or catch this exception.
- **Directory creation**: `ensureDir` assumes `projectRoot` is writable; verify permissions in CI environments.

- **Backward compatibility:** If older code expected a different file layout, update imports accordingly and run integration tests.
