Overview

`packages/graph-core/src/plugins/registry.ts` now contains a `PluginRegistry` class (added at line 11).

It centralizes analyzer plugin management and language resolution via `LanguageRegistry` (imported at lines 1-2).

Key changes

- **Imports** – type imports for `AnalyzerPlugin`, `StructuralAnalysis`, `ImportResolution`, `CallGraphEntry` (R1) and a runtime import of `LanguageRegistry` (R2).
- **Class definition** – fields: `plugins: AnalyzerPlugin[]`, `languageMap: Map<string, AnalyzerPlugin>`, and `languageRegistry: LanguageRegistry` (R12-14).
- **Constructor** – accepts an optional `LanguageRegistry`; defaults to `LanguageRegistry.createDefault()` (R16-18).
- **Plugin lifecycle** –
 - `register(plugin)` pushes to `plugins` and populates `languageMap` (R20-24).
 - `unregister(name)` removes the plugin, clears and rebuilds `languageMap` (R27-36).
- **Lookup helpers** – `getPluginForLanguage(language)` (R39-41), `getPluginForFile(filePath)` (R43-47), and `getLanguageForFile(filePath)` (R52-54).
- **Analysis delegation** – `analyzeFile`, `resolveImports`, and `extractCallGraph` forward to the appropriate plugin if available (R56-72).
- **Introspection** – `getPlugins()` and `getSupportedLanguages()` expose current state (R74-80).

Impact

- **Correctness** – replaces hard-coded language lookups with `LanguageRegistry` (commented at R8-10).
- **Maintainability** – a single registry simplifies adding/removing plugins; tests can mock `LanguageRegistry`.
- **Performance** – `register` / `unregister` rebuild the map in linear time relative to the number of plugins.
- **Compatibility** – no changes to existing plugin interfaces; only a new entry point for consumers.

Risks & follow-ups

- Duplicate language entries across plugins will overwrite earlier mappings (`languageMap.set` in `register`).

- `unregister` clears and rebuilds the map; verify that stale entries are removed and subsequent lookups reflect the updated state.
- Confirm that `LanguageRegistry.createDefault()` populates all supported file types.
- Run integration tests to ensure delegation methods (`analyzeFile` , `resolveImports` , `extractCallGraph`) correctly route to the right plugin after registration changes.
