

packages/graph-core/src/plugins/tree-sitter-plugin.test.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:37:20.817Z

Overview

A new test file, `packages/graph-core/src/plugins/tree-sitter-plugin.test.ts`, has been added. It imports `vitest` (`describe`, `it`, `expect`, `beforeAll`) and the `TreeSitterPlugin` implementation. The file contains 307 added lines that exercise the plugin's parsing, import resolution, call-graph extraction, and metadata.

Key changes

- **Imports** – Lines 1-2 show the added imports for `vitest` and `TreeSitterPlugin`.
- **analyzeFile tests** – Lines 12-186 cover extraction of functions, arrow functions, classes, imports, and exports for both TypeScript and JavaScript sources.
- **resolveImports test** – Lines 238-262 verify that relative imports are resolved to absolute paths and that external packages keep their original names.
- **extractCallGraph test** – Lines 265-294 confirm that function calls are linked correctly (`main` → `greet`, `greet` → `formatMessage`).
- **Metadata tests** – Lines 297-305 assert that `plugin.name` is `"tree-sitter"` and that `plugin.languages` includes `"typescript"` and `"javascript"`.

Impact

- Adds ~307 lines of test code, raising coverage for the `TreeSitterPlugin`.
- Provides concrete expectations for AST parsing, import resolution, call-graph extraction, and metadata exposure.

Risks & follow-ups

- **Regression risk** – Any change to the public API of `TreeSitterPlugin` may break these tests; run the suite after refactors.
- **Environment dependency** – Tests rely on `vitest` and the compiled plugin; ensure the build pipeline includes these dependencies.
- **Path resolution** – The `resolveImports` test assumes a project layout rooted at `/project/src/index.ts`; verify that this path remains valid in all environments.
