Overview

A new file `packages/graph-core/src/types.ts` (lines 1-204) introduces a comprehensive type system for graph modeling, analysis metadata, and plugin contracts.

Key changes

- **Node & Edge types** – `NodeType` (lines 1-7) lists 21 node categories; `EdgeType` (lines 9-19) lists 35 edge categories across structural, behavioral, data-flow, and knowledge relations.
- **Metadata interfaces** – `KnowledgeMeta` (lines 21-27) and `DomainMeta` (lines 29-35) add optional fields for knowledge- and domain-specific nodes.
- **Graph core interfaces** – `GraphNode` (lines 39-53) and `GraphEdge` (lines 55-63) model nodes and edges with attributes such as `layerId`, `complexity`, `direction`, and `weight`.
- **Project & analysis metadata** – `ProjectMeta`, `KnowledgeGraph`, `ThemeConfig`, `AnalysisMeta`, and `ProjectConfig` (lines 82-118) expose configuration and persistence structures.
- **Structural analysis & plugin contracts** – `StructuralAnalysis` (lines 171-183) defines analysis results; `AnalyzerPlugin` (lines 197-204) specifies plugin APIs (`analyzeFile`, optional `resolveImports`, `extractCallGraph`, `extractReferences`).
- **Supporting interfaces** – `SectionInfo`, `DefinitionInfo`, `ServiceInfo`, `EndpointInfo`, `StepInfo`, `ResourceInfo`, `ReferenceResolution`, `ImportResolution`, and `CallGraphEntry` (lines 124-196) provide detailed sub-structures for non-code entities.

Impact

- **Compile-time:** New exports expand the public surface; modules importing from `graph-core` must reference this file or adjust imports.
- **Runtime:** No executable code is added; the change is purely type-level, so no performance or memory impact.
- **Compatibility:** As a new file, it does not break existing code, but consumers must ensure the file is included in the build (tsconfig, package exports).

Risks & follow-ups

- Verify `tsconfig.json` includes `packages/graph-core/src/types.ts` and that module resolution paths are correct.
- Run the full test suite to confirm that no imports inadvertently shadow the new interfaces.
- Ensure that the `AnalyzerPlugin` interface aligns with current plugin implementations; update any mismatched method signatures if necessary.

- Update documentation and code comments to reflect the expanded type definitions, especially for plugin developers.
