

packages/graph-core/tsconfig.json

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:21:55.954Z

Overview

A new `tsconfig.json` file was added at `packages/graph-core/tsconfig.json` (lines 1-19). It defines the TypeScript build configuration for the `graph-core` package.

Key changes

- **File added:** `packages/graph-core/tsconfig.json` (R1-19).
- **Compiler options** (R2-R6):
 - `target: "ES2022"`
 - `module: "ESNext"`
 - `lib: ["ES2022"]`
 - `moduleResolution: "bundler"`
- **Strictness flags** (R7-R10): `strict`, `esModuleInterop`, `skipLibCheck`, `forceConsistentCasingInFileNames`.
- **Output settings** (R15-R16): `outDir: "dist"`, `rootDir: "src"`.
- **Declarations & maps** (R12-R14): `declaration`, `declarationMap`, `sourceMap`.
- **Includes** (R18): `include: ["src"]`.

Impact

- The package now compiles independently, isolating its TypeScript settings from the workspace.
- Modern JavaScript features are enabled (`ES2022` target, `ESNext` module).
- Strict type-checking and declaration generation may surface previously hidden type errors.
- Compile time could increase due to stricter checks and map generation.

Risks & follow-ups

- **Compatibility:** Verify that downstream consumers can handle `ES2022` output and `ESNext` modules.
- **Type regressions:** Run the package's unit tests and a quick smoke test to catch any new errors introduced by `strict: true`.
- **Bundler behavior:** Ensure that `moduleResolution: "bundler"` works with the existing bundler configuration (e.g., Rollup, Webpack).
- **Documentation:** Update any build-related docs to reference the new `tsconfig.json`.
