

packages/graph-view/src/EmbedGraphPanel.tsx

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:33:36.089Z

Overview

A new `EmbedGraphPanel` component is added in `packages/graph-view/src/EmbedGraphPanel.tsx` (lines 263-279). It renders a lightweight overview graph with `@xyflow/react` and does not depend on the global Zustand store.

Key changes

- **Imports** – React hooks (`useEffect`, `useMemo`, `useRef`, `useState`) and XYFlow utilities (`Background`, `Controls`, `MiniMap`, `ReactFlow`, etc.) are added (lines 5-18).
- **Utility** – `buildNodesById` (lines 39-46) builds a `Map<string, GraphNode>` for fast lookup.
- **Layout logic** – ``use`

Overview

`LayoutForGraph` (lines 47-154) constructs layer-cluster nodes, aggregates edges, runs ELK layout asynchronously, and exposes `{ nodes, edges, layoutStatus }`.

- **Viewport handling** – `EmbedFitViewOnce` (lines 156-184) calls `fitView` once after the flow is mounted to avoid infinite loops.
- **Rendering** – ``Embed`

Overview

`Flow` (lines 186-218) renders the flow with interactions disabled; `EmbedSizedFlowMount` (lines 220-257) mounts the flow only when the host element has non-zero dimensions, using a `ResizeObserver`.

- **Public API** – `EmbedGraphPanelProps` (lines 259-261) and `EmbedGraphPanel` (lines 263-279) expose the panel, showing a "Computing layout..." overlay while `layoutStatus` is `"computing"`.

Impact

- **Self-contained** – no global state, reducing side-effects.
- **Asynchronous layout** – ELK runs in a promise; the overlay prevents UI freezes.
- **Clear separation** – layout, sizing, and rendering are isolated in hooks and small components, easing future maintenance.

Risks & follow-ups

- **Layout accuracy** – verify ELK output for complex graphs; visual regression tests are recommended.

- **Resize handling** – confirm `ResizeObserver` triggers re-mount correctly across browsers.
- **Edge cases** – empty or single-node graphs fall back to `EMPTY_OVERVIEW` ; ensure no crashes.
- **Styling** – component relies on CSS variables (`--color-edge-dot` , `--glass-bg`); check they exist in all themes.
