

packages/graph-view/src/NovaDiffGraphExplorer.tsx

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:34:23.126Z

Overview

A new component `NovaDiffGraphExplorer.tsx` is added under `packages/graph-view/src`. It exposes the public API `NovaDiffGraphExplorerProps` and `NovaDiffGraphDiffOverlay`, and implements an embed-mode wrapper and a full explorer that validates a knowledge graph, updates the dashboard store, and renders a skeleton while layout is prepared.

Key changes

- **File:** `packages/graph-view/src/NovaDiffGraphExplorer.tsx` (lines 1-146).
- **Imports:** React hooks, `validateGraph` from `@novadiff/graph-core/schema`, types `GraphIssue`, `KnowledgeGraph`, and `useDashboardStore`.
- **Interfaces:**
 - `NovaDiffGraphDiffOverlay` (lines 16-20).
 - `NovaDiffGraphExplorerProps` (lines 21-33).
- **Component:** `NovaDiffGraphExplorer` (lines 34-42) delegates to `NovaDiffGraphExplorerEmbed` when `embedMode` is true, otherwise to `NovaDiffGraphExplorerFull`.
- **Utility:** `graphFingerprint` (lines 44-55).
- **Full explorer** `NovaDiffGraphExplorerFull` (lines 56-146): validates the graph via `validateGraph`, updates the store (`setGraph`, `setDiffOverlay`, view mode), handles load errors and hydration, memoizes embed context, renders a skeleton UI, and wraps `DashboardContent` with `NovaDiffEmbedContext`, `I18nProvider`, and `ThemeProvider`.

Impact

- Graph validation occurs client-side; errors appear as `<p className="novadiff-graph-load-error">`.
- Centralizes explorer logic; new interfaces provide clear contracts.
- Fingerprint caching prevents redundant validation; `useMemo` avoids recreating context values.
- Relies on existing store actions (`setGraph`, `setDiffOverlay`, `setViewMode`, `setIsKnowledgeGraph`, `navigateTo`

Overview

`).

Risks & follow-ups

- Store API drift: verify `useDashboardStore` still exposes the required actions.
- Dependency updates: ensure `@novadiff/graph-core/schema` still exports `validateGraph` and `GraphIssue`.

- Effect dependencies: `useEffect` lists `[graph, setGraph]` ; confirm `setGraph` is stable.
- Embed mode handling: confirm `NovaDiffGraphExplorerEmbed` consumes `embedMode` correctly and no duplicate context providers are introduced.
