

packages/graph-view/src/components/Breadcrumb.tsx

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:16:06.755Z

Overview

A new `Breadcrumb` component is added at `packages/graph-view/src/components/Breadcrumb.tsx` (lines R1-R40). It reads navigation state from the global store and renders a breadcrumb UI that adapts to the current view (overview or layer detail).

Key changes

- **Imports**
 - `useDashboardStore` from `../store` [R1]
 - `useI18n` from `../contexts/I18nContext` [R2]
- **Export**
 - `export default function Breadcrumb()` [R4]
- **State hooks**
 - `navigationLevel`, `activeLayerId`, `graph`, ``navigateTo`

Overview

``` from the store [R5-R8]

- `t` from the i18n context [R9]
- **Rendering logic**
  - When `navigationLevel === "overview"` a pill shows ``t.breadcrumb.project`

### Overview

``` [R15-R18]

- When `navigationLevel === "layer-detail"` a breadcrumb chain shows:
 - Project button (calls ``navigateTo`

Overview

`)` [R22-R28] – Separator `>` [R29] – Active layer name or
`default t.layer.defaultName` [R30-R32] – Escape-back hint `t.breadcrumb.escBack`` [R33-R35]

- **Styling** – Tailwind classes for positioning, colors, and typography.

Impact

- **Correctness** – The component expects the store to expose `navigationLevel`, `activeLayerId`, `graph`, and ``navigateTo`

Overview

```. If any are missing, the UI may render empty or throw errors.

- **Maintainability** – Adds a public component that should be documented and exported from the package index. Future changes to store keys or i18n keys must be reflected.
- **Performance** – Minimal; only a few store reads and a simple render tree.
- **Compatibility** – Requires the `I18nContext` provider and the `useDashboardStore` hook to be available in the consuming app.

## Risks & follow-ups

- **Store contract** – Verify that `useDashboardStore` provides the expected keys and that ``navigateTo`

## Overview

``` is a function.

- **i18n keys** – Ensure ``t.breadcrumb.project`

Overview

`, t.breadcrumb.project`, `t.layer.defaultName`, and `t.breadcrumb.escBack`` exist; otherwise the UI will show empty strings.

- **Graph safety** – The code safely handles `graph` being `undefined`, but `graph?.layers` must be an array; otherwise `find` will error.
- **Testing** – Add unit tests for both navigation levels, mocking the store and i18n context.
- **Export** – Confirm the component is re-exported from the package's index file so it can be imported elsewhere.
