

packages/graph-view/src/components/DiffToggle.tsx

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:19:12.989Z

Overview

A new `DiffToggle` component is added under `packages/graph-view/src/components`. It introduces a UI button to toggle diff overlay visibility, leveraging the dashboard store and `i18n` context.

Key changes

- **Imports added:** `useDashboardStore` from `../store` and `useI18n` from `../contexts/I18nContext`.
- **State hooks:** `diffMode`, `toggleDiffMode`, `changedNodeIds`, and `affectedNodeIds` are extracted from the store.
- **Computed flag:** `hasDiff` checks if any nodes have changed (`changedNodeIds.size > 0`).
- **Button behavior:**
 - `onClick` triggers `toggleDiffMode`.
 - Disabled when `!hasDiff`.
 - Dynamic classes and titles based on `diffMode` and `hasDiff`.
- **Conditional rendering:** When diff is active and data exists, a legend shows counts of changed and affected nodes with color indicators.
- **Export:** `export default function DiffToggle()` makes the component available for import elsewhere.

Impact

- **UI:** Adds a new toggle button; no existing components are modified.
- **State:** Requires `diffMode`, `toggleDiffMode`, `changedNodeIds`, and `affectedNodeIds` to exist in the dashboard store; otherwise runtime errors.
- **Internationalization:** Depends on `t.diffToggle.*` keys; missing keys will result in undefined strings.
- **Styling:** Uses CSS variables (`--color-diff-changed`, `--color-diff-affected`); missing variables may break appearance.
- **Performance:** Minimal; only a few store reads and a simple button render.

Risks & follow-ups

- Verify that the dashboard store exposes the required fields (`diffMode`, `toggleDiffMode`, `changedNodeIds`, `affectedNodeIds`).
- Ensure `i18n` keys `diffToggle.hideOverlay`, `diffToggle.showOverlay`, `diffToggle.noData`, `diffToggle.changed`, and `diffToggle.affected` exist.
- Confirm CSS variables for diff colors are defined in the theme; otherwise the legend will not display correctly.

- Run unit tests for the new component to catch any missing dependencies or rendering issues.
