

packages/graph-view/src/components/DomainGraphView.tsx

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:20:19.533Z

Overview

Adds a `DomainGraphView.tsx` component that renders domain graphs with ReactFlow and an ELK layout. The component replaces a previous placeholder and introduces node types for domains, flows, and steps.

Key changes

- **Imports** (lines 1-24): React hooks, ReactFlow components, `Edge / Node` types, styles, node components (`DomainClusterNode` , `FlowNode` , `StepNode`), store hooks (`useDashboardStore`), `i18n` (`useI18n`), layout utilities (`mergeElkPositions` , `nodesToElkInput` , `applyElkLayout`), and graph types.
- **BuiltGraph interface** (lines 36-40) and helper `getDomainMeta` (lines 32-34).
- `**`buildDomain`

Overview

``**` (lines 42-89): creates domain-cluster nodes and cross-domain edges.

- **buildDomainDetail** (lines 91-166): builds flow and step nodes, calculates ordering and counts, and produces edges between flows and steps.
- **DomainGraphViewInner** (lines 168-272):
 - Memoizes the structural graph (`built`) based on `domainGraph` and `activeDomainId` .
 - Runs an async ELK layout in a `useEffect` ; cancellation logic prevents stale updates.
 - Stores layout issues via `useDashboardStore.getState().appendLayoutIssues` .
 - Renders `ReactFlow` with `nodeTypes` , controls, minimap, and background.
- **Export** (lines 275-281): `DomainGraphView` wraps the inner component in `ReactFlowProvider` .

Impact

- Introduces a fully functional graph view; no API changes.
- Requires `useDashboardStore` and `useI18n` to be initialized.
- New node types (`domain-cluster` , `flow-node` , `step-node`) must have corresponding component implementations.
- Layout computation is async; layout issues are surfaced through the store.

Risks & follow-ups

- **Cleanup**: The effect's cancellation logic is present, but its effectiveness on unmount is unknown from the diff.
- **Performance**: Impact of large graphs on render time is unknown from the available evidence.
- **Position mapping**: Correctness of `mergeElkPositions` mapping node IDs is unknown.

- **Issue reporting:** Whether `appendLayoutIssues` is wired to the UI is unknown from the diff.
