

packages/graph-view/src/components/MobileDrawer.tsx

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:28:44.200Z

Overview

A new `MobileDrawer` component is added at `packages/graph-view/src/components/MobileDrawer.tsx`. It renders a slide-out panel for mobile views, exposing persona selection, view toggles, diff overlay, node-type filters, layer legend, and tool actions.

Key changes

- **Imports** (lines 1-6): `useEffect`, `useDashboardStore`, `useI18n`, `PersonaSelector`, `DiffToggle`, `LayerLegend`.
- **Interfaces** (lines 11-17, 18-22): `Props` (`open`, `onClose`, `onTogglePathFinder`, `onShowKeyboardHelp`) and `NodeTypeFilterDef` (`key`, `label`, `color`).
- **SectionLabel** (lines 26-32): helper rendering a styled `<h3>`.
- **MobileDrawer** (lines 34-266): default export.
 - Pulls graph state via `useDashboardStore`.
 - Builds `structuralFilters` and `knowledgeFilters` from `i18n` labels.
 - Two `useEffect` hooks: one for Escape key handling (lines 63-70) and one to lock body scroll while open (lines 72-80).
 - Conditional view toggle when `graph` exists, not a knowledge graph, and `domainGraph` is present (lines 82-84).
 - Renders sections for persona, view, diff overlay, node types, layers, and tools, wiring actions to callbacks and store mutations.

Impact

- **Correctness**: relies on existing store hooks and `i18n`; integration tests should verify state changes.
- **Maintainability**: component is self-contained; helper `SectionLabel` keeps the file readable.
- **Performance**: only two lightweight `useEffect` hooks and conditional rendering.
- **Compatibility**: no breaking changes to existing APIs; the component is exported as default, so imports elsewhere must be updated.

Risks & follow-ups

- Verify that `useDashboardStore` selectors (`graph`, `isKnowledgeGraph`, etc.) return expected values on first render; stale data could hide the drawer.
- Ensure the Escape key listener is removed correctly when the drawer closes to avoid memory leaks.
- Confirm that all `i18n` keys (`t.drawer.*`) exist; missing keys will render `undefined`.

- Run visual regression tests to catch CSS class mismatches (`pointer-events-auto` , `translate-x-0` , etc.) that could affect the slide animation.
