

packages/graph-view/src/components/MobileLayout.tsx

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:29:27.655Z

Overview

A new `MobileLayout` component is added at `packages/graph-view/src/components/MobileLayout.tsx`. It replaces the desktop layout on mobile, providing a full-screen UI with graph, info, and file tabs, plus code viewer, keyboard help, and path-finder modals.

Key changes

- **Imports** (lines 1-6): React hooks, `GraphIssue` type, `useDashboardStore`, `useI18n`, and static imports for `GraphView`, `DomainGraphView`, `KnowledgeGraphView`, `SearchBar`, `NodeInfo`, ``Project`

Overview

, `FileExplorer`, `WarningBanner`, `MobileBottomNav`, `MobileDrawer`. Lazy imports for `CodeViewer`, `LearnPanel`, `PathFinderModal`, `KeyboardShortcutsHelp``.

- **Props interface** (`interface Props`, lines 22-28): `accessToken`, `showKeyboardHelp`, `setShowKeyboardHelp`, `loadError`, `allIssues`, `shortcuts`.
- **State & effects** (lines 51-64): `activeTab`, `drawerOpen`, `searchOpen`; `useEffect` hooks auto-pivot to the info tab on node selection and close the search bar when the code viewer opens.
- **Conditional rendering** (lines 150-170): Tab panes are `absolute inset-0` containers toggled with `invisible pointer-events-none`; `aria-hidden` is set on inactive panes (lines 153, 168, 177). View mode selects `KnowledgeGraphView`, `DomainGraphView`, or `GraphView` (lines 155-161).
- **Modals & drawers** (lines 195-213, 216-223, 226-230): `MobileDrawer`, `MobileBottomNav`, `CodeViewer`, `KeyboardShortcutsHelp`, and `PathFinderModal` are wrapped in `Suspense` with a `null` fallback.

Impact

- **Store usage:** Relies on `useDashboardStore` selectors (`graph`, `selectedNodeId`, `tourActive`, `persona`, `viewMode`, `domainGraph`, `codeViewerOpen`, `closeCodeViewer`, `pathFinderOpen`, `togglePathFinder`). Missing selectors will crash the component.
- **Prop contract:** Callers must provide the new props; omission causes TypeScript errors or runtime failures.
- **Testing:** Existing desktop-layout tests need adaptation; new tests should cover tab switching, modal visibility, and state persistence.

Risks & follow-ups

- **Missing props:** Verify all callers pass `accessToken` , `showKeyboardHelp` , etc.
- **Store selector changes:** Ensure `useDashboardStore` still exposes the required fields.
- **Lazy load failures:** Consider adding error boundaries or fallback UI for the lazy components.
- **Accessibility:** Confirm that `aria-hidden` logic correctly hides inactive panes for screen readers.
