

packages/graph-view/src/components/StepNode.tsx

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:33:57.489Z

Overview

A new `StepNode` component was added to `packages/graph-view/src/components/StepNode.tsx`. It defines a typed node for the graph flow, memoizes the component, and connects to the dashboard store for selection handling.

Key changes

- **Imports** (lines 1-4): added `memo` from `react`; `Handle`, `Position` from `@xyflow/react`; type imports for `Node` and `NodeProps`; and `useDashboardStore` from the local store.
- **Data contract** (lines 6-12): `export interface StepNodeData extends Record<string, unknown>` with `label`, `summary`, optional `filePath`, `stepId`, and `order`.
- **Node type** (line 14): `export type StepFlowNode = Node<StepNodeData, "step-node">`.
- **Component** (lines 16-51): renders a styled div with left/right handles, displays order, label, summary, optional file path, and uses store hooks to determine selection state and dispatch `selectNode`.
- **Memoization** (line 53): exported as `export default memo(StepNode)`.

Impact

- **Type safety:** The `StepNodeData` interface ensures that node data conforms to the expected shape at compile time.
- **Render efficiency:** `memo` prevents re-renders when unrelated props change.
- **Centralized definition:** `StepFlowNode` simplifies future extensions or refactors of node types.
- **Store interaction:** The component reads `selectedNodeId` and calls `selectNode` from the dashboard store, enabling consistent selection state across the graph.

Risks & follow-ups

- **Store integration:** Verify that `selectNode` and `selectedNodeId` exist in the store; missing keys will cause runtime errors.
- **Styling consistency:** Ensure CSS classes (`border-accent`, `bg-elevated`, etc.) are defined; otherwise the node may appear broken.
- **Handle positioning:** Confirm that `Position.Left` and `Position.Right` align with the graph layout; misplacement could affect drag behavior.
- **Testing coverage:** Add unit tests for rendering, selection logic, and memoization to guard against future regressions.
