

packages/graph-view/src/components/ThemePicker.tsx

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:34:31.981Z

Overview

A new `ThemePicker` component is added at `packages/graph-view/src/components/ThemePicker.tsx` (lines 1-180). It renders a button that toggles a dropdown for selecting theme presets, accent colors, and heading fonts. The component relies on the existing `useTheme` hook, the `PRESETS` array, and the `i18n` context.

Key changes

- **Imports** (R1-R4): `` `ts import { useCallback, useEffect, useRef, useState } from "react"; import { useTheme, PRESETS } from "../themes/index.ts"; import type { HeadingFont } from "../themes/index.ts"; import { useI18n } from "../contexts/I18nContext";

`` - ****Export**** (R6): `export function ThemePicker()` .

- **State & refs** (R8-R10): `open` toggle, `ref` to the root element, and `t` from `useI18n` .
- **Event handling** (R12-R32): two `useEffect` hooks close the picker on outside clicks and on the Escape key.
- **Preset handling** (R34-R39): `handlePreset` calls `setPreset` from `useTheme` .
- **Render tree** (R41-R179): a button toggles the dropdown; the dropdown contains preset buttons, accent swatches, and heading-font options, styled with Tailwind-like utility classes and conditional classes based on the current config.

Impact

- The component mutates theme state via `setPreset` , `setAccent` , and `setHeadingFont` .
- It depends on the `PRESETS` data structure and `i18n` keys such as `t.themePicker.changeTheme` .
- New CSS classes (`glass-heavy` , `bg-accent/15` , etc.) are introduced; they must exist in the global stylesheet.

Risks & follow-ups

- **Data shape**: Verify that `PRESETS` contains `id` , `colors` , `accentSwatches` , and `defaultAccentId` .
- **i18n keys**: Ensure `t.themePicker.*` translations are defined; otherwise missing text will appear.
- **Event handling**: Test that clicking outside or pressing Escape closes the picker across browsers.
- **Theme hook**: Confirm that `useTheme` exposes `setPreset` , `setAccent` , and `setHeadingFont` ; otherwise the component will error.
