

packages/graph-view/src/index.css

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:35:00.972Z

Overview

`packages/graph-view/src/index.css` is a new stylesheet (added 426 lines, range R1-426). It imports Tailwind (`@import "tailwindcss";` – line 1) and declares a custom `@theme` block (lines 3-84) that defines dozens of CSS variables for colors, typography, and node-type styles.

Key changes

- **Tailwind import** – line 1 pulls in the utility framework.
- **Theme variables** – the `@theme` block (lines 3-84) introduces variables such as `--color-root`, `--color-surface`, `--color-accent`, `--glass-bg`, and many node-type colors.
- **Scoped base styles** – selectors `.novadiff-graph-explorer-root`, `.novadiff-graph-theme-host` (lines 100-109) set font, background, and color using the new variables.
- **Noise overlay** – a fixed pseudo-element (`.noise-overlay::before`, lines 111-122) adds a low-opacity SVG noise texture, scoped to the explorer panel via `.novadiff-graph-embed.noise-overlay::before` (lines 125-128).
- **Glass utilities** – `.glass` and `.glass-heavy` (lines 131-144) use `backdrop-filter` for translucent panels.
- **Custom scrollbar** – WebKit and non-WebKit styles (lines 237-251) replace the default scrollbar with a thin, themed thumb.
- **Animations** – keyframes (`fadeSlideIn`, `slideUp`, `accentPulse`) and utility classes (`.animate-fade-slide-in`, `.animate-accent-pulse`) (lines 164-205).
- **Diff & node glow** – classes `.node-glow`, `.diff-changed-glow`, `.diff-affected-glow` (lines 208-219) provide visual feedback for graph changes.

Impact

- **Styling consistency** – all graph-view UI now relies on the new CSS variables; hard-coded colors elsewhere may need updating.
- **Performance** – the file is scoped; it should not affect global styles.
- **Browser support** – uses `backdrop-filter` and custom scrollbars; older browsers may lack support.
- **Testing** – unit tests that check CSS class presence or color values may need re-running.

Risks & follow-ups

1. **Tailwind import failure** – verify that `"tailwindcss"` resolves in the build pipeline.
2. **Variable leakage** – ensure the `@theme` block does not override unrelated components; run a smoke test on a page without Graph View.
3. **Scrollbar compatibility** – confirm the custom scrollbar does not interfere with other scrollable areas.

4. **Noise overlay interference** – verify the overlay is correctly scoped to the explorer panel.
