Overview

A new file `packages/graph-view/src/locales/index.ts` (lines R1-R32) introduces a lightweight locale system for the graph-view module. It imports JSON locale files, defines a `LocaleKey` union, exposes a `Locale` type, and provides helper functions to retrieve and resolve locales.

Key changes

- **Imports** (R1-R5) ``ts import en from "./en"; import zh from "./zh"; import zhTW from "./zh-TW"; import ja from "./ja"; import ko from "./ko";

```
- **Types** (R7-R8) ts export type LocaleKey = "en" | "zh" | "zh-TW" | "ja" | "ko"; export type
Locale = typeof en; - **Locale map** (R10-R16) ts export const locales: Record<LocaleKey,
Locale> = { en, zh, "zh-TW": zhTW, ja, ko, }; - **Accessor** (R18-R20) ts export function
getLocale(key: LocaleKey): Locale { return locales[key] ?? locales.en; } - **Resolver**
(R22-R29) ts export function resolveLocaleKey(lang: string | undefined): LocaleKey { if (!lang) return
"en"; const normalized = lang.toLowerCase().replace(/[_\s]/g, "-"); if (normalized === "zh" ||
normalized === "chinese" || normalized === "zh-cn") return "zh"; if (normalized === "zh-tw" ||
normalized === "traditional-chinese") return "zh-TW"; if (normalized === "ja" || normalized ===
"japanese") return "ja"; if (normalized === "ko" || normalized === "korean") return "ko"; return "en";
} - **Re-exports** (R32) ts export { en, zh, zhTW as "zh-TW", ja, ko };
```

- Centralizes locale definitions and resolution logic, simplifying future language additions.
- Provides deterministic lookup with a clear fallback to `en`.
- No existing code is altered; consumers must import from the new path to use the locale system.

Risks & follow-ups

- ****Missing locale files****: Verify that `en.json`, `zh.json`, `zh-TW.json`, `ja.json`, and `ko.json` exist and export valid objects.
- ****Alias correctness****: Ensure that `zhTW as "zh-TW"` re-export works for downstream consumers.
- ****Resolver edge cases****: Add tests for uncommon language strings (e.g., `"zh\_cn"`, `"japanese"`) to confirm mapping.
- ****Type safety****: Run the TypeScript compiler to confirm that `LocaleKey` and `Locale` types are inferred correctly across the repo.
