

packages/graph-view/src/themes/index.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:49:05.541Z

Overview

`packages/graph-view/src/themes/index.ts` now aggregates theme-related exports.

The file adds five lines (R1-R5) that re-export symbols from the theme implementation modules.

Key changes

- **R1:** `export { ThemeProvider, useTheme } from './ThemeContext.tsx';`
- **R2:** `export { PRESETS, getPreset, getAccent } from './presets.ts';`
- **R3:** `export { applyTheme } from './theme-engine.ts';`
- **R4:** `export type { HeadingFont, PresetId, ThemeConfig, ThemePreset, AccentSwatch } from './types.ts';`
- **R5:** `export { DEFAULT_THEME_CONFIG } from './types.ts';`

These lines expose the public API for theme configuration, provider, and utilities.

Impact

- Consumers can import theme symbols from a single entry point:
`import { ThemeProvider } from 'graph-view/themes';`
- No new runtime logic is introduced; the file only re-exports existing modules.
- The public surface is now centralized, simplifying discoverability and maintenance.
- The file must be part of the package's public API (e.g., referenced in `src/index.ts` or `package.json`).

Risks & follow-ups

- Verify that `packages/graph-view/src/themes/index.ts` is emitted in the build output; missing it will break imports.
- Run unit tests that import these symbols to ensure they resolve correctly.
- Ensure re-exported types do not collide with existing global types.
- Confirm that the new exports do not expose internal implementation details that should remain private.
