

packages/graph-view/src/utils/__tests__/containers.test.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:43:57.019Z

Overview

A new test file `packages/graph-view/src/utils/__tests__/containers.test.ts` (lines 1-131) has been added. It imports `vitest` helpers, the `deriveContainers` function, and `GraphNode` / `GraphEdge` types.

Key changes

- **Imports** added at lines 1-3.
- **Helper** `node(id, filePath?)` defined lines 5-14 to create minimal `GraphNode` objects.
- **Folder-strategy tests** (`describe` block starting line 17) cover:
 - grouping by first folder segment (lines 18-24),
 - stripping longest common prefix (lines 35-43),
 - collapsing nested folders into the first segment (lines 45-53),
 - placing nodes without `filePath` into a `"~"` container (lines 55-64),
 - suppressing single-child containers (lines 66-78),
 - returning a flat list when total nodes < 8 (lines 80-89).
- **Community-fallback tests** (`describe` block starting line 92) cover:
 - fallback to community clustering when only one folder exists (lines 93-115),
 - fallback when one folder holds > 70 % of nodes (lines 117-130).
- **Synthetic edges** are built (lines 98-108) to trigger community detection logic.

Impact

- Adds coverage for edge cases in `deriveContainers` ; no production code is modified.
- Centralizes node creation via the `node` helper, simplifying future test additions.

Risks & follow-ups

- Test ordering may affect deterministic results; `containers.map(...).sort()` is used in several assertions (lines 28-29, 52, 63, 75, 88).
- Snapshot drift is unknown from the diff; run `vitest --update` if failures occur.
- CI integration is unknown; verify that the new file is picked up by the existing test runner.
