

packages/graph-view/src/utils/__tests__/edgeAggregation.test.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T20:44:28.774Z

Overview

A new test file `packages/graph-view/src/utils/__tests__/edgeAggregation.test.ts` has been added. It imports `vitest` helpers, the `aggregateContainerEdges` function, and type definitions from `@novadiff/graph-core/types`. A helper `ce` creates `GraphEdge` objects with default `type="calls"` and `direction="forward"`.

Key changes

- **Imports (lines 1-3)** ```ts import { describe, it, expect } from "vitest"; import { aggregateContainerEdges } from "../edgeAggregation"; import type { GraphEdge, EdgeType } from "@novadiff/graph-core/types";`

```- **Helper ce (lines 5-11)**` – constructs a `GraphEdge` with the specified source, target, and optional type.

- **Test suite (lines 13-79)**
  - Empty input returns empty arrays (lines 14-18).
  - Intra-container edges are preserved (lines 20-28).
  - Same-direction inter-container edges are merged into a single aggregated edge with correct `count` and `edgeTypes` (lines 30-45).
  - Opposite directions produce separate aggregated edges (lines 47-58).
  - Edges whose endpoints lack a container mapping are ignored (lines 60-65).
  - Container IDs containing the separator character are handled correctly via length-prefixing (lines 67-78).

### Impact

The tests exercise the aggregation logic for a range of scenarios without altering any public API. No snapshots are used, so no fixture refresh is required.

### Risks & follow-ups

- If `aggregateContainerEdges` is modified, these tests may fail; run the suite after changes.
- Verify that the new file passes the repository's TypeScript and linting checks.
- No snapshot drift concerns exist.
