

packages/graph-view/src/vite-env.d.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:37:41.058Z

Overview

A new TypeScript declaration file was added to the graph-view package.

Key changes

- File `packages/graph-view/src/vite-env.d.ts` added.
- Contains a single line: `/// <reference types="vite/client" /> .`

Impact

- The reference imports Vite client types, making Vite-specific globals (e.g., `import.meta.env`) available to the TypeScript compiler.
- No runtime code is added; the file is only used at compile time.
- The package now requires the `vite` types (or the `vite` package) to be present in `devDependencies`.

Risks & follow-ups

- Ensure `vite` or `@types/vite` is listed in `devDependencies`; otherwise the reference will fail.
- Verify that the file is included in the TypeScript `include` array; otherwise the reference is ignored.
- Run `npm run lint`, `npm test`, and `npm run build` to confirm no new type errors or build failures.
- Monitor CI for any unexpected type-checking regressions.
