

## src/app/llmStorage.ts

Kind: modified · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:04:45.292Z

### Overview

The `LlmSummarizePayload` interface in `src/app/llmStorage.ts` was extended with five optional properties to provide richer context for code-snippet summarization. The changes appear in the diff at lines 56-61 of the interface definition.

### Key changes

- `explainCode?: boolean` – flag to indicate that the LLM should explain a code snippet.
- `codeExcerpt?: string` – the snippet text.
- `lineStart?: number` and `lineEnd?: number` – the snippet's line range.
- `symbolName?: string` – the symbol being summarized.

These additions are added after the existing `selectionSymbol` property.

### Impact

- Existing payloads remain valid; the new fields are optional, so no breaking changes.
- Consumers can now include snippet context without modifying the interface contract.
- No runtime errors are introduced by the change.

### Risks & follow-ups

- Verify that serialization of `LlmSummarizePayload` to JSON omits undefined fields.
- Update unit tests that validate payload shape to account for the optional properties.
- Ensure that prompt-generation logic handles `explainCode` and the snippet metadata correctly.
