

src/app/workspaceTypes.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:06:14.626Z

Overview

A new file `src/app/workspaceTypes.ts` is added to the repository. It contains only TypeScript interface declarations that model workspace state, commit snapshots, Git history options, and GitHub tooling status. No existing files are modified.

Key changes

- **GitUserProfile** (lines 1-6): defines `login`, `name`, `avatarUrl`, `hostname`, and `authenticatedAt`.
- **WorkspaceCommitSnapshot** (lines 9-17): describes a commit's `hash`, `shortHash`, `subject`, `authoredAt`, `snapshotPath`, optional `docsPath`, and optional `indexedAt`.
- **NovaWorkspace** (lines 19-33): models a workspace's `id`, `name`, `repoRoot`, optional `githubSlug`, `dataDir`, timestamps, `historyStatus`, optional `historyError`, optional `historyProgress`, an array of `WorkspaceCommitSnapshot`, and an optional `liveDevRepoRoot`.
- **GitHistoryCompareOptions** (lines 35-38): optional `useLiveHead` flag and optional `liveRepoRoot`.
- **GhToolingStatus** (lines 40-51): indicates whether GitHub tooling is installed, its path, version, auto-install capability, install method, command, label, manual URL, hint, and a reason string.
- **WorkspaceSessionState** (lines 53-58): ties together the user profile, active workspace ID, list of `NovaWorkspace`, and a `localOnlyMode` flag.

Impact

- **Type safety:** Consumers can import these interfaces to replace ad-hoc shapes, reducing runtime type errors.
- **Documentation:** The interfaces serve as a living specification for the workspace domain, aiding onboarding and code reviews.
- **No runtime changes:** The file contains only type declarations; it does not affect compiled JavaScript output or performance.
- **Future integration:** Services that previously used implicit shapes will need to import these interfaces for consistency.

Risks & follow-ups

- **Missing imports:** Verify that modules expecting workspace shapes now import from `src/app/workspaceTypes.ts`.
- **API surface expansion:** External consumers relying on old implicit shapes may need to update type references.
- **Documentation sync:** Ensure README or API docs reflect the new interfaces.

- **Linting:** Run `tsc` and lint to confirm no unused imports or circular dependencies were introduced.
