Overview

A new React component, `AutoCommitWorkspace`, is added to `src/components/AutoCommitWorkspace.tsx`. It renders a UI that lets a user generate an AI-summarized commit message, review it, and optionally publish the commit and open a pull request. The component relies on Electron APIs exposed via `window.electronAPI` and an LLM summarizer.

Key changes

- **Imports** (lines 1-9): added React hooks, Lucide icons, and types/functions from `commitMessage`, `docWorkspaceMetrics`, `llmStorage`, and `types`.
- **Props interface** (`AutoCommitWorkspaceProps`, lines 12-21): defines `suggestedRepoPath`, `compared`, `compareRows`, root paths, titles, and `llmSettings`.
- **Component implementation** (`AutoCommitWorkspace`, lines 25-381):
 - State for repo status, preview, draft content, loading flags, and UI step.
 - Callbacks: `refreshRepo`, `generateDraft`, `executePublish`, and `browseRepo`.
 - Uses `window.electronAPI` for git status, publish preview, LLM summarization, and publish execution.
 - Renders sections for repository status, draft generation, review, and publish, with conditional UI based on `step`.
- **Helper function** `pathBasename` (lines 383-387) extracts the repo name from a path.
- **UI elements**: Buttons, inputs, and icons (`Upload`, `Check`, `GitBranch`, `Loader2`) tied to the new state logic.

Impact

- Adds an end-to-end auto-commit workflow; bundle size grows slightly due to new imports.
- Requires the Electron API surface (`gitRepoStatus`, `gitPublishPreview`, `llmSummarize`, `gitPublishExecute`, `writeNovadiffDocs`, `pickDirectory`) to be present; missing methods will cause runtime errors.
- `buildDocWorkspaceMetrics` runs on every `compareRows` change; large diffs may affect responsiveness.
- New CSS classes (`git-workspace`, `doc-workspace-panel`, etc.) must exist for proper layout.

Risks & follow-ups

- **API availability**: Verify that `window.electronAPI` exposes all required methods; otherwise the component will fail at runtime.
- **Type consistency**: Ensure imported types (`LlmSettings`, `FileChange`, `GitRepoStatus`, `PublishPreview`) match the actual API contracts.

- **Metric computation:** Benchmark `buildDocWorkspaceMetrics` for large `compareRows` to confirm acceptable performance.
- **UI correctness:** Test conditional rendering for each `step` value and confirm that the UI behaves correctly on various screen sizes.
