

src/components/BackgroundActivityBar.tsx

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:07:41.701Z

Overview

A new component `BackgroundActivityBar` is added to `src/components` (lines 15-68). It renders a live status bar for background tasks, showing each task's label, optional detail, elapsed time, and a progress bar that can be indeterminate.

Key changes

- **Imports** (lines 1-3): `useEffect`, `useState` from `React`; `useBackgroundActivity` from the context; `usePrefersReducedMotion` for accessibility.
- **Utility** (lines 5-12): `formatElapsed(ms)` converts milliseconds to `Xs` or `Xm Ys`.
- **State & effect** (lines 18-26): `now` is updated every 500 ms via `setInterval`; the interval is cleared on unmount.
- **Render logic** (lines 32-66):
 - Returns `null` if `activities.length === 0`.
 - Maps `activities` to DOM nodes, using `activity.id` as key.
 - Displays `activity.label`, optional `activity.detail`, and elapsed time from `formatElapsed(now - activity.startedAt)`.
 - Shows a progress bar: if `activity.progress` is `null`, the bar is indeterminate (`is-indeterminate`); otherwise it sets `width` to the rounded percentage.
- **Accessibility** (lines 33-35): `role="status"`, `aria-live="polite"`, `aria-atomic="false"`.
- **Reduced motion** (line 44): adds `is-animated` to the pulse element unless `reduced` is true.

Impact

- **UI**: Provides visual feedback for background operations.
- **Performance**: The 500 ms interval is lightweight; renders only when activities change.
- **Accessibility**: Live region and reduced-motion handling improve inclusivity.
- **Maintainability**: The component is self-contained, with a clear utility function and minimal external dependencies.
- **Compatibility**: Requires `useBackgroundActivity` to supply `id`, `label`, `detail`, `startedAt`, and optional `progress`.

Risks & follow-ups

- **Memory leak**: The cleanup in `useEffect` clears the interval, but verify in edge cases.
- **CSS dependencies**: Classes such as `background-activity-bar`, `is-animated`, and `is-indeterminate` must exist.
- **Context contract**: Ensure `useBackgroundActivity` returns the expected shape; mismatches will break rendering.

- **Usage:** The file is added but not yet imported elsewhere; add it to the app layout or test its presence in the component tree.
