

src/components/InsightsColumn.tsx

Kind: modified · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:13:25.388Z

Overview

`InsightsColumn` now accepts a `prefetchProgress` prop and renders a visual progress bar instead of a plain text status. The component's layout has been tweaked: the summary panel uses a keyed `div` with an enter animation class, and the file-summary section no longer wraps its content in a generic scroll container.

Key changes

- **New prop:** `prefetchProgress?: { current: number; total: number } | null` added to `InsightsColumnProps` (line 28).
- **Summary panel:** replaced `<div className="insights-scroll">` with `<div key="summary" className="insights-scroll insights-panel-enter">` (lines 106-108).
- **Prefetch status UI:** removed the plain `<p>` (line 189) and added a `<div className="insights-prefetch-status doc-state-enter">` containing a progress bar that shows either a determinate fill or an indeterminate track (lines 191-212).
- **File-summary footnote:** the reserved-path warning and chunk hint logic remain unchanged; only the prefetch status rendering changed.
- **Minor refactor:** the `ChangedFilesTree` container now uses a keyed `div` with `insights-panel-enter` (lines 258-261).

Impact

- **UX:** Users now see a visual indicator of prefetch progress, improving feedback during large diff operations.
- **Maintainability:** Adding the `prefetchProgress` prop centralizes progress handling; the component no longer relies on a global state for this UI.
- **Performance:** The progress bar uses CSS transitions; no new heavy computations are introduced.
- **Compatibility:** Existing callers must supply the new prop (or `null`) to avoid TypeScript errors; backward-compatibility is preserved by making it optional.

Risks & follow-ups

- **Regression:** Verify that components consuming `InsightsColumn` still compile after the prop change; run the TypeScript build.
- **UI consistency:** Ensure the new progress bar styles (`insights-prefetch-status`, `insights-prefetch-track`) are present in the CSS and that animations trigger correctly.
- **Accessibility:** The progress bar currently lacks ARIA attributes; consider adding `role="progressbar"` and `aria-valuenow/aria-valuemin/aria-valuemax` for screen readers.

- **Testing:** Add unit tests to confirm that `prefetchProgress` renders the correct fill percentage and that the indeterminate state appears when `total` is zero or `null`.
