

src/components/ui/AnimatedOverlay.tsx

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:27:33.182Z

Overview

A new UI overlay component, `AnimatedOverlay`, is added in `src/components/ui/AnimatedOverlay.tsx` (lines 1-79). It provides animated show/hide behavior, respects reduced-motion preferences, and handles keyboard and backdrop interactions.

Key changes

- **Imports** – `useEffect`, `useState` from React (R1) and a custom `usePrefersReducedMotion` hook (R2).
- **Constant** – `CLOSE_MS = 300` (R4).
- **Props interface** – `AnimatedOverlayProps` (R6-R13) exposes `open`, `onClose`, `backdropClassName`, `panelClassName`, optional `labelledBy`, and `children`.
- **Component** – exported at R15.
 - State: `mounted` and `visible` (R24-R25).
 - First `useEffect` (R27-R43) mounts/unmounts the overlay, triggers visibility, and schedules a close delay (`CLOSE_MS` or 0 for reduced motion).
 - Second `useEffect` (R45-R56) listens for the Escape key to call `onClose`.
- **Render** – returns `null` when not mounted (R58-R60). Otherwise renders a dialog with classes `ui-overlay`, `ui-overlay-panel`, and dynamic `is-open` / `is-closing` (R62-R78). Backdrop click triggers `onClose` (R70-R74).

Impact

- **Accessibility** – dialog role, `aria-modal`, and optional `aria-labelledby`.
- **Animation** – double `requestAnimationFrame` sequence (R34-R36) for smooth transitions; reduced-motion path skips animation.
- **Centralization** – animation logic is contained in one component, simplifying future adjustments.
- **No breaking changes** – existing files are untouched; the new component is fully controlled via props.

Risks & follow-ups

- The component imports `usePrefersReducedMotion`; ensure this hook exists and returns a boolean.
- CSS classes `ui-overlay`, `ui-overlay-panel`, `is-open`, and `is-closing` must be defined; otherwise visual behavior will be missing.
- Verify that `onClose` fires on Escape key and backdrop click; missing event listeners could leave the overlay open.

- The double `requestAnimationFrame` call (R34-R36) may cause layout thrashing on very old browsers; test across target environments.
