

src/components/ui/WorkspaceStage.tsx

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T19:28:28.885Z

Overview

A new component `WorkspaceStage` is added at `src/components/ui/WorkspaceStage.tsx` (lines 1-22). It wraps page content and conditionally applies an enter animation based on the user's reduced-motion preference.

Key changes

- **Imports:** `ReactDOM` from `"react"` (R1) and `usePrefersReducedMotion` from `"../../app/usePrefersReducedMotion"` (R2).
- **Props interface** `WorkspaceStageProps` (R4-R7) with `pageKey: string` and `children: ReactDOM`.
- **Component** `WorkspaceStage` (R9-R22) that:
 - Calls `const reduced = usePrefersReducedMotion();` (R10).
 - Renders `<div className="workspace-stage">` containing an inner `<div>` keyed by `pageKey` with class `workspace-stage-inner` and, unless `reduced` is true, the additional class `ui-view-enter` (R14-R17).

Impact

- **Additive:** no existing files are modified; the component can be used independently.
- **Runtime:** adds one extra DOM node per render and a conditional class check; negligible performance cost.
- **Dependencies:** requires the `usePrefersReducedMotion` hook to be exported and the CSS class `.ui-view-enter` to be defined; missing either will affect animation or cause runtime errors.

Risks & follow-ups

- **Hook availability:** confirm `usePrefersReducedMotion` is exported and works in all target environments; otherwise the build will fail.
- **CSS presence:** verify that `.ui-view-enter` is defined;
