

tsconfig.json

Kind: modified · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T21:04:30.504Z

Overview

The root `tsconfig.json` was modified to broaden the TypeScript compilation scope. At line 23 the `include` array was replaced with: ```json "include": ["src", "packages/graph-view/src/NovaDiffGraphExplorer.tsx", "packages/graph-view/src/index.ts"]`

- ``include`` changed from ``["src"]`` to the three-item array above (diff line 23).
- No other compiler options were altered.
- The change is limited to the root configuration file.

Impact

- The two new files will now be type-checked and bundled as part of the build.
- The compiler will consider these files when resolving modules, potentially exposing new exports.
- Incremental compilation will track them, but the effect on build time or artifact size is unknown from the diff.

Risks & follow-ups

- **Type errors**: Verify that ``NovaDiffGraphExplorer.tsx`` and ``index.ts`` compile without errors (``tsc --noEmit``).
- **Duplicate declarations**: Ensure these files do not re-export symbols already exposed elsewhere.
- **Build artifacts**: Confirm the new files appear in the final bundle (e.g., via Webpack/Vite).
- **CI pipeline**: Check that the CI build passes with the expanded ``include`` set; potential OOM issues on limited-memory runners are unknown from the available evidence.
