What it does `is_test_like_path` determines whether a given relative file path should be treated as part of the test suite. It returns `true` if the path is associated with the `"tests"` role, otherwise `false`.

How it works The function receives a string slice `rel` representing a relative path. It calls `detect_file_roles(rel)`, which (by convention) returns a collection of role identifiers for that path. The returned collection is iterated with `.iter()`, and `.any(|role| role == "tests")` checks if any role equals the literal string `"tests"`. If such a role exists, the closure returns `true`, causing `any` to short-circuit and the function to return `true`; otherwise it returns `false`.

Notes for reviewers- The function relies on the external `detect_file_roles` implementation; its behavior is unknown from the snippet.- The comparison uses a string literal, so it is case-sensitive and exact.- No side effects or state changes occur; the function is pure.- The function is concise but could be expanded with pattern matching if more roles are needed.
