What it does `sendGithubAuthProgress` sends a progress update to the renderer process during GitHub authentication. It takes an `event` (typically an IPC event) and an optional `payload`. If the event's sender is a valid, non-destroyed `webContents`, it forwards the payload—defaulting to an empty object—on the `"github-auth-progress"` channel.

How it works

- `event?.sender` uses optional chaining to safely access `sender`.
- `wc.isDestroyed()` checks whether the `webContents` has been closed.
- `wc.send` is the Electron IPC method that delivers the message to the renderer.

Notes for reviewers

- **Unknown from the snippet:** the exact type of `event` (e.g., `IpcMainEvent`), the type of `wc` (likely `WebContents`), and the signature of `wc.send`.
- **Unknown:** whether `payload` is always an object, or if other types could be passed.
- **Unknown:** error handling—`wc.send` may throw or return a promise that could reject.
- **Unknown:** side effects beyond
