

electron/liquid-glass.cjs

Kind: added · Baseline: 984f0748954a · Target: NovaDiff · Generated: 2026-05-27T05:47:39.272Z

Overview

A new file `electron/liquid-glass.cjs` is added. It provides optional native Liquid Glass support on macOS by lazily loading the `electron-liquid-glass` addon and exposing a single exported function `applyLiquidGlassToWindow`.

Key changes

- `loadLiquidGlass()` (lines 6-19) requires `electron-liquid-glass` only on first call, caches the module, and falls back to `null` if the require fails. A warning is logged (`console.warn`) when the addon is unavailable.
- `applyLiquidGlassToWindow()` (lines 29-56) checks `process.platform` and returns `{ enabled: false, reason: "platform_not_supported" }` on non-darwin systems (lines 30-32).
- It verifies the window exists and is not destroyed before attempting to add a view (lines 33-35).
- If the addon is missing or `addView` is not a function, it returns `{ enabled: false, reason: "module_unavailable" }` (lines 36-38).
- The function attempts to add a view with specific options (corner radius, tint, opacity) and sets window button visibility. On success it returns `{ enabled: true, viewId }`; on failure it logs a warning and returns `{ enabled: false, reason: "apply_failed" }` (lines 41-54).
- The module exports only `applyLiquidGlassToWindow` (lines 58-60).

Impact

- Graceful degradation: the addon is optional; missing modules or unsupported platforms do not crash the app.
- Lazy loading and caching reduce overhead; subsequent calls reuse the cached module.
- Console warnings provide visibility into missing addon or application errors.

Risks & follow-ups

- If `electron-liquid-glass` is unavailable on macOS, the function will log a warning and return disabled; verify that this behavior is acceptable.
- API stability of `win.setWindowButtonVisibility` and `addView` is unknown from the diff; monitor for changes in future Electron releases.
- No tests are added in this change; consider adding unit tests for supported/unsupported platforms and destroyed window scenarios.
- Bundle size impact of the optional `require` is unknown; confirm that the production bundle remains unchanged when the addon is absent.
