Overview

In `packages/graph-view/src/themes/ThemeContext.tsx`, the `ThemeProvider` API now accepts an optional `scopeToHost` flag. When true, theme tokens are applied only to a wrapper element instead of the global `document.documentElement`. The helper `resolveInitialTheme` was extended to accept this flag and skip the local-storage lookup.

Key changes

- `resolveInitialTheme` (L49-55) now takes `scopeToHost?: boolean`; if true it returns `metaTheme ?? DEFAULT_THEME_CONFIG` without reading local storage.
- `ThemeProvider` signature (L60-62) gains `scopeToHost?: boolean`; the initial state is created with `resolveInitialTheme(metaTheme, scopeToHost)`.
- **Theme application** (L67-85) branches: `applyTheme(config, host)` when `scopeToHost` is true, otherwise `applyTheme(config)`.
- **Local-storage persistence** (L86-90) is skipped when `scopeToHost` is true (`initialized.current && !scopeToHost`).
- **Cleanup** (L96-102) clears the theme only on the host element when `scopeToHost` is true.
- **Meta-theme update** (L106-113) now updates the config immediately if `scopeToHost` and a `metaTheme` are present, and the effect dependency list includes `scopeToHost`.
- **Wrapper element** (L134-140) is rendered only when `scopeToHost` is true, providing a `ref` (`hostRef`) for scoped styling.

Impact

- **Global CSS isolation:** When `scopeToHost` is true, theme variables are confined to the wrapper, preventing accidental overrides of other parts of the app.
- **Local-storage behavior:** Theme selections are not persisted while scoped; this is intentional per the new logic.
- **Cleanup correctness:** `clearTheme` is invoked only on the host element during unmount, avoiding stray CSS variables.

Risks & follow-ups

- **Regression:** Components that previously relied on global theme variables may break when `scopeToHost` is enabled; visual regression tests are recommended.
- **Persistence loss:** Confirm that non-persistence of user-selected themes while scoped is acceptable for the intended use case.
- **Dependency validation:** The updated `useEffect` dependencies (`[metaTheme, scopeToHost]`) should be reviewed to avoid stale closures or unnecessary re-applications.
