

packages/graph-view/src/utils/activeLayer.ts

Kind: added · Baseline: 46a8da0664d1 · Target: NovaDiff · Generated: 2026-05-19T22:50:54.981Z

Overview

A new utility `packages/graph-view/src/utils/activeLayer.ts` is added to resolve the active layer from a `KnowledgeGraph`. It introduces a synthetic project-wide layer ID and handles both normal and project-wide cases.

Key changes

- **Import** `KnowledgeGraph` type (R1).
- **Constant** `PROJECT_WIDE_LAYER_ID = "__novadiff_project__"` (R4).
- **Exported function** `resolveActiveLayer` (R6).
- Handles `null` graph or `activeLayerId` (R10-12).
- Special case for `PROJECT_WIDE_LAYER_ID`: aggregates all node IDs across layers or falls back to all nodes (R13-32).
- Normal case: finds the layer by ID and returns its metadata (R34-43).
- Returns `null` if the layer is not found (R35-36).

Impact

- **Correctness:** Guarantees a consistent view for the project-wide synthetic layer, preventing missing node data when no layers exist.
- **Maintainability:** Centralizes layer resolution logic; other modules can import `resolveActiveLayer` instead of duplicating code.
- **Performance:** Linear scans over `graph.layers` and `graph.nodes`; acceptable for current graph sizes.
- **Compatibility:** No API changes; purely an internal helper.

Risks & follow-ups

- Verify that `graph.layers` and `graph.nodes` are populated as expected; otherwise the fallback logic may return incomplete data.
- Ensure `PROJECT_WIDE_LAYER_ID` does not collide with real layer IDs in future data models.
- Add unit tests covering both the synthetic layer and normal layer resolution paths.
- Confirm that the deduplication via `Set` correctly handles duplicate node IDs across layers.
