

src/app/gitTypes.ts

Kind: added · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T21:25:20.472Z

Overview

A new file `src/app/gitTypes.ts` (added lines 1-125) defines a set of TypeScript interfaces that model Git tooling status, GitHub authentication, repository and pull-request summaries, local repo matching, blame analysis, file status, publishing previews, and execution payloads.

Key changes

- `GitToolingStatus` (lines 1-6) – exposes Git availability, version, error, and a nested `GithubAuthStatus`.
- `GithubAuthStatus` (lines 10-16) – flags for availability, login, user, hostname, scopes, and a message.
- `GithubRepoSummary` (lines 19-27) – lightweight repo metadata.
- `GithubPullRequestSummary` (lines 30-41) – PR metadata including number, title, state, refs, author, and draft flag.
- `LocalRepoMatch` (lines 43-47) – path, name, slug, and remote URL.
- `GitBlameOwner` (lines 50-54) – author, line count, ratio.
- `GitBlameAtRefResult` (lines 56-62) – blame result structure.
- `GitStatusFile` (lines 64-69) – file path, status, staged/unstaged flags.
- `GitRepoStatus` (lines 71-82) – repo root, branch, head, upstream, sync counters, dirty flag, files, remotes, subdir.
- `PrCompareRoots` (lines 84-88) – roots and refs for comparison.
- `PublishPreview` (lines 91-102) – preview of a publish operation.
- `PublishExecuteResult` (lines 104-111) – result of executing a publish.
- `PublishExecutePayload` (lines 113-125) – payload for a publish request.

Impact

- Provides a unified type surface for all git-related data, improving compile-time type safety.
- No runtime code is added; the change is purely declarative.
- Existing modules can import these interfaces from `src/app/gitTypes.ts` for clearer contracts.

Risks & follow-ups

- Verify that imports reference the correct path (`src/app/gitTypes.ts`).
- Ensure no name clashes with existing symbols in other modules.
- Run the TypeScript compiler and the test suite to confirm no type errors arise from the new definitions.
