

## src/app/llmStorage.ts

Kind: modified · Baseline: 8e0dc031dcfc · Target: NovaDiff · Generated: 2026-05-19T21:26:43.997Z

### Overview

`src/app/llmStorage.ts` extends the `LlmSummarizePayload` interface with five optional properties that provide richer context for LLM summarization. The additions appear at lines 56-61 of the file.

### Key changes

- `explainCode?: boolean` – flag to request a code explanation.
- `codeExcerpt?: string` – raw code snippet.
- `lineStart?: number` – start line of the excerpt.
- `lineEnd?: number` – end line of the excerpt.
- `symbolName?: string` – name of the symbol to explain.

These fields are added after the existing `selectionSymbol` property in the interface.

### Impact

- **Compatibility:** Existing payloads remain valid because the new fields are optional.
- **Functionality:** Callers can now supply additional context, potentially improving LLM responses.
- **Performance:** Adding optional properties does not alter runtime behavior.

### Risks & follow-ups

- Verify that modules importing `LlmSummarizePayload` compile after the change.
- Update any test fixtures or mocks that construct `LlmSummarizePayload` to include the new optional fields if desired.
- Ensure JSON serialization logic (e.g., `JSON.stringify`) handles the new fields without affecting existing output.
- Run `npm run lint`, `npm test`, and the production build to confirm no new warnings or errors.
