

src/components/DiffWorkspace.tsx

Kind: modified · Baseline: 46a8da0664d1 · Target: NovaDiff · Generated: 2026-05-19T22:42:36.057Z

Overview

`DiffWorkspace` now displays the selected folder paths in a read-only, formatted form and no longer accepts user edits. The component internally renames the `onLeft` / `onRight` callbacks to `_onLeft` / `_onRight` and removes the `title` attributes that previously showed the raw paths.

Key changes

- **Import added:** `pathDisplayLabel` from `../app/pathDisplay` (line 7).
- **Prop destructuring:** `onLeft` and `onRight` are captured as `_onLeft` / `_onRight` (lines 63-64).
- **Input values:** `value={pathDisplayLabel(leftRoot)}` and `value={pathDisplayLabel(rightRoot)}` replace the raw `leftRoot` / `rightRoot` (lines 125-126, 160-161).
- **Read-only inputs:** `readOnly` flag added to both path selectors (lines 126, 161).
- **Removed handlers:** `onChange` callbacks and `title` attributes are gone (lines 124-129, 160-165).
- **External API unchanged:** `DiffWorkspaceProps` still exposes `onLeft` / `onRight`; the component forwards them via the renamed internal variables.

Impact

- **UI behavior:** Users can no longer edit the path fields; they must use the browse buttons.
- **Accessibility:** Removing `title` attributes may reduce tooltip help, but the formatted label is now clearer.
- **Maintainability:** Centralizing path formatting in `pathDisplayLabel` reduces duplication and eases future styling changes.
- **Performance:** Minor; the component now performs a single formatting call per render instead of handling change events.
- **Compatibility:** Existing callers remain unaffected because the public prop names are unchanged.

Risks & follow-ups

- **Regression:** Verify that the browse buttons still correctly update the parent state via `_onLeft` / `_onRight`.
- **Accessibility:** Ensure screen readers still announce the path values; consider adding `aria-label` if needed.
- **Testing:** Update unit tests that previously expected editable inputs or `title` attributes.
- **Documentation:** Update any docs or README sections that mention editable path fields.
